

A General target: a group-specific divergence bounded by temporal reconvergence

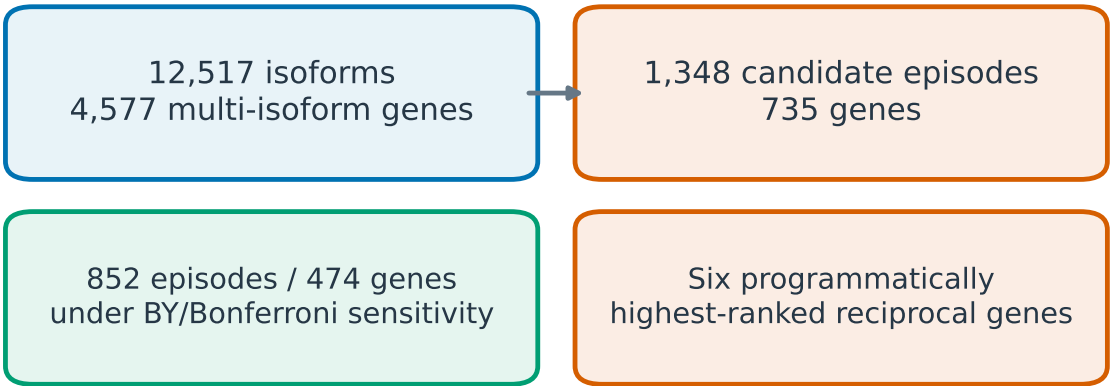

B Model-agnostic post-inference decision layer

Required design: at least three ordered stages, one focal group, at least two comparison groups and biological replication.

The framework organises statistically supported components into candidate temporal episodes; it does not replace the underlying DTU model.

C Application to the mouse developmental brain archive

Leading genes: Scg3, Gpm6a, Ntrk2, Tecr, Armc8, Bin1

One-at-a-time threshold sensitivities: 802--1,588 episodes.

All six leading genes were unchanged under the dependence-robust analysis.
